

Virtual Technical Conference Platform

Requirements Table

ID	Type	Description	Priority	Acceptance Criteria	Rationale
FR-001	Functional	The system shall anonymize submitted manuscripts by removing author-identifying information before assigning them to reviewers for double-blind review.	High	Pass: Reviewer can access the paper without seeing author identity. Fail: Author identity is visible to reviewer.	Maintains fairness and confidentiality during the review process.
FR-002	Functional	The system shall assign submitted manuscripts to appropriate reviewers while preventing conflicts of interest.	High	Pass: Papers are assigned only to eligible reviewers with no declared conflict. Fail: A paper is assigned to a conflicted reviewer.	Ensures unbiased and reliable paper evaluation.
FR-003	Functional	The system shall generate a multi-track conference presentation schedule based on room capacity and speaker availability.	High	Pass: A conflict-free schedule is generated with valid rooms and available speakers. Fail: Schedule contains room-capacity or speaker-availability conflicts.	Prevents scheduling conflicts and ensures smooth conference organization.
FR-004	Functional	The system shall allow conference participants to submit questions during live presentation sessions and display them in a session-specific Q&A queue.	Medium	Pass: A participant's question appears in the correct session's Q&A queue. Fail: The question is missing or appears in another session.	Enables real-time interaction between participants and presenters.
FR-005	Functional	The system shall allow participants to upvote questions in the live Q&A queue and order questions based on their upvote count.	Medium	Pass: Upvoted questions are ranked according to their current upvote count. Fail: Upvotes are not recorded or ranking is incorrect.	Helps presenters identify the questions of greatest interest to participants.
NFR-001	Performance & Security	The system shall generate the multi-track conference schedule while satisfying room capacity and speaker availability constraints within 10 seconds under expected peak load.	High	Pass: Benchmarking confirms schedule generation completes within 10 seconds under simulated peak load. Fail: Generation exceeds the target latency.	Ensures the scheduling process remains usable even with many sessions and constraints.
NFR-002	Security & Privacy	The system shall protect author identities and submitted manuscript information from unauthorized access throughout the double-blind review process.	High	Pass: Unauthorized users cannot access author identities or restricted manuscripts. Fail: Restricted information is exposed to unauthorized users.	Protects confidential research information and preserves the integrity of double-blind review.
